Jet Propulsion Laboratory

UIA Presentation– April 2012

## Outline

- What does JPL do?
- Who are we?
- What we do!
  - Chronology of Sampling technology development
    - Lithotripsy
    - Ultrasonic Sonic Driller Corer USDC
    - USDC –Ultrasonic Rock Abrasion Tool (URAT)
    - Inverted Stepped Horns
    - Folded Horns
    - Flipped horns
    - Dog Bone Horns
    - Flexure Monolithic Horns
    - Asymmetrically grooved horns

What do we do?

Currently over 30 missions with JPL instruments

Exploring the Solar System (March 2012)

[illegible]

3

## Example of a current Mission at JPL!

Jet Propulsion Laboratory

UIA Presentation– April 2012

## Advanced Technologies Group/ NDEAA Lab - Who Are We?

### Compilation of Physicists and Mechanical Engineers with backgrounds in Ultrasonics, Mechanisms, Piezoelectrics, NDE, Dynamics

Jet Propulsion Laboratory  
California Institute of Technology

**NDEAA**  
Nondestructive Evaluation and Advanced Actuators Technologies

Privacy/Copyright

The JPL's Nondestructive Evaluation and Advanced Actuators (NDEAA) Technologies lab is involved with innovative research and development (R&D) for space applications and technology transfer to other fields. It was established by [Dr. Joseph Bar-Cohen](#) in May 1991 and it is part of his JPL's Advanced Technologies Group for which he is the Supervisor. Dr. Bar-Cohen and his Group members are internationally leading scientists in the field of electroactive materials and related mechanisms. The members of his Group are [Dr. Mircea Badescu](#), [Dr. Xiaoqi Bao](#), [Dr. Zensheu Chang](#), [Dr. Shyh-Shiuh Lih](#), and [Dr. Stewart Sherit](#). In addition, thru the JPL Educational Outreach Program, [professors, visiting scientists and students](#) are participating in various studies at this lab. A homepage of the NDEAA Lab is part of the [JPL's Science and Technology Website](#). The topics of R&D include novel actuators (mostly using electroactive ceramics and polymers), drilling and sampling systems, transducers, sensors, robotic mechanisms and NDE methods. The group conducts analytical modeling, development, design and fabrication of novel mechanisms and devices, performance testing and characterization as well as analysis that involve mechanical, electrical, magnetic and thermal parameters and interactions. Between Jan. 1, 2000 and Jul. 2, 2001, this NDEAA webhub had 1,000,007 (crossed the one million) total hits with 87,082 unique hits and by Sept. 3, 2001 it crossed the one hundred thousand (100,000) unique hits. The highest hits per day was recorded on March 9, 2005, where 9063 total hits and 3626 unique hits were recorded. This lab has been the subject of [many articles in the news media](#). The NDEAA lab is involved with a broad range of R&D topics as described in the following clickable icons. The photos of the NDEAA members are clickable to their biography.

## What we do: Our Niche

Jet Propulsion Laboratory

UIA Presentation – April 2012

### Sampling

- ☐ Drills
- ☐ Corers
- ☐ Rock Abrasion Tools
- ☐ Powder Samplers

### Sample Handling

- ☐ Powder Vibrators
- ☐ Vibrating Funnels
- ☐ Vibrating Sample Holders

### Micro-positioners

- ☐ Active mirrors
- ☐ Linear Actuators
- ☐ Rotary Actuators

Usually use piezoelectric materials  
Although we are open to other ways of doing it!!!

## Micro-positioners eg. Space Interferometry Mission

Jet Propulsion Laboratory

UIA Presentation – April 2012

- 3 interferometers
- 2x7.2 and 9 m baselines
- Earth trailing solar orbit
- 5.5 year mission life with goal of 10 years
- Over 200 piezoelectric stacks
- MISSION CANCELLED - 2011

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Micro-positioners – SIM – Our role

Develop a series of life tests to insure full mission life

❑ AC lifetest#1 60 Vpp, 2kHz,  $10^{10}$  cycles

❑ AC lifetest#2 20 Vpp, 2kHz,  $10^{11}$  cycles

❑ DC life test - 100 Volts DC- Controlled Humidity  
Incomplete due to mission cancellation

❑ See Sherrit et al. 2008, 2011

## MSL Instrument - CHEMIN – XRD XRF – Sample cell shaker and inlet funnel

Jet Propulsion Laboratory

UIA Presentation – April 2012

Original Design- problems at Mars ambient and under launch random vibe.

## Sample Handling – Our Role

Jet Propulsion Laboratory

UIA Presentation – April 2012

MSL has 21 piezoelectric actuators for sample handling and instrument cells

- 2 on SAM inlet funnel
- 3 on CHEMIN inlet funnel for powder delivery assist
- 16 on CHEMIN instrument sample wheel

See Sherrit et al. 2009

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Sample Handling – Our Role

### MSL Sample cell Shakers Re-design

Phillippe Sarrazin (Inxitu) came up with tuning fork design and with Eric Olds (Swales) they came up with

#### Problems

- 1/ Thermal analysis showed marginal thermal stress on piezoelectric
- 2/ Wheel mounting created anisotropic stress. (Energy to wheel)

## Sample Handling – Our Role

Jet Propulsion Laboratory

UIA Presentation – April 2012

### MSL Sample cell Shakers Re-design fine tuning -

### Solutions

- 1/ Shorten Piezoelectric
- 2/ Use Invar end caps
- 3/ Use ball/set screw mount
- 4/ Soften Tuning fork
- 5/ make base symmetric

See <http://msl-scicorner.jpl.nasa.gov/Instruments/CheMin/>

# Sampling

Jet Propulsion Laboratory

UIA Presentation – April 2012

Started out looking at pure ultrasonics with Cybersonics Inc. (Erie, PA)  
Discussions with Cybersonics Inc. led to the development of the USDC

Figure 8. Schematic cross section of the drill assembly with restoring spring and impedance matching mass.

First paper describing the technology - see Sherrit et al. (1999)

Jet Propulsion Laboratory

UIA Presentation – April 2012

# Sampling

Initial development was mainly experimental- looking at ways to improve or expand the technology.

<http://www.youtube.com/watch?v=phLiWya1sGo>

First real engineering occurred when USDC was selected (URAT) for backup Rock Abrasion Tool on the Mars Exploration Rovers (MER)

# Sampling

Jet Propulsion Laboratory

UIA Presentation – April 2012

(URAT) Ultrasonic Rock Abrasion Tool -Mechanical design and fabrication along with flight like electronics (FPGA switching H-bridge)

The initial response was, “This is great. Can you make it Shorter?”  
Which is how we started to develop novel Ultrasonic horns

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Sampling – Folded Horns

Q: How do you create at 20 kHz ultrasonic horn and make it short?

A1: Fold it

Axisymmetric Models

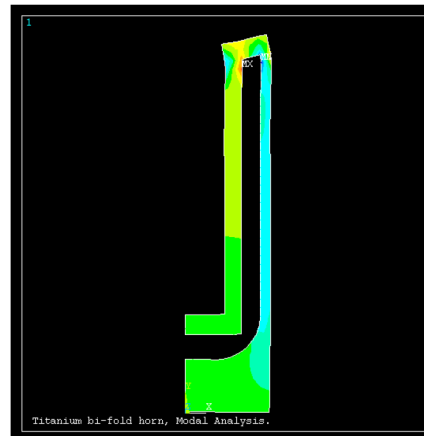

Stepped

Inverted  
Stepped

1 fold

2 fold

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Sampling – Folded Horns

Design and tested the doubly  
Folded horn-

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Sampling – Folded Horns

Incorporated the horn in a non-pneumatic rock powder sampler

We also came up with a solid planar  
Monolithic version. See Sherrit et al. 2002

Jet Propulsion Laboratory

UIA Presentation – April 2012

# Sampling – Flipped Horns

	Flipped horn	Standard horn	Difference (%)
Resonance frequency (Hz)	18061	17950	0.61
Horn-tip disp. (m), 1 volt	$4.62 \times 10^{-7}$	$4.63 \times 10^{-7}$	0.22
Electric current (amp), 1 volt	$1.05 \times 10^{-2}$	$1.04 \times 10^{-2}$	0.95
Max. stress (Pa), 1 volt	$2.50 \times 10^6$	$2.24 \times 10^6$	10.4
Horn-tip disp. (m), 1 watt	$4.51 \times 10^{-6}$	$4.54 \times 10^{-6}$	0.67

Table 1. Comparison of performance of the flipped and the standard horns.  
See Chang et al. 2005

## Sampling – Dog-bone Horns

For an impact device the interaction time is of the order of  $50 \mu\text{s}$   
 Which suggest at the tip for maximum momentum transfer the tip  
 Thickness should be less than  $\approx 50 \mu\text{s} * 4000 \text{ m/s} = 0.02 \text{ m}$

The 5 designs of ultrasonic horn studied:

- a) Conventional
- b) Neck at middle span of horn
- c) Neck moved down 20 mm
- d) Neck moved up 20 mm
- e) No neck

Horn Type	Horn length (mm)	Resonance (Hz)	Anti-Resonance (Hz)	Coupling Factor	Max. Displacement (mm)
Conventional	250	5314	5726	0.372	0.209
Neck at middle	200	5473	5947	0.391	0.185
Neck up 20 mm	175	5421	5916	0.400	0.185
Neck down 20 mm	255	5266	5666	0.369	0.209
No Neck	240	5304	6016	0.472	0.133

See Chang et al. 2004

# Sampling – Dog-bone Horns Analytical Modeling

Jet Propulsion Laboratory

UIA Presentation – April 2012

Integrated program package:  
Modal analysis – Resonance  
Modal analysis – Anti-resonance  
Harmonic analysis  
Simplified integrated model  
Impact analysis  
Spring-mass model

Resonance frequency 5195Hz

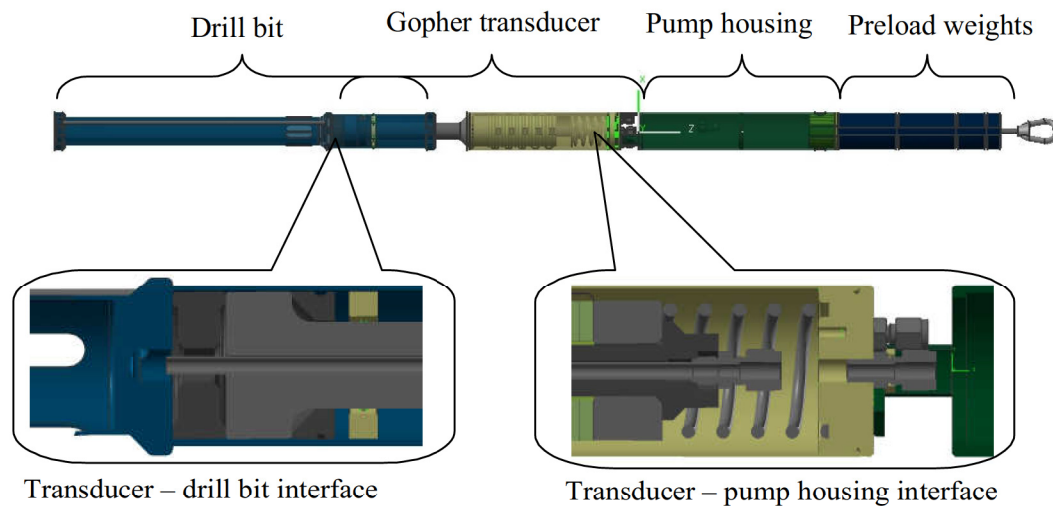

## Sampling – Used Dog-bone Horn to produce Ice gopher Wire-line hammer drill

Jet Propulsion Laboratory

UIA Presentation – April 2012

Components

- Gopher
- Actuator(Transducer)
- Drill bit
- Free mass
- Pump
- Preload

## Gopher Design Fabrication

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Gopher Field Trips – Mt. Hood, Oregon

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Gopher Field Trips – Lake Vida, Antarctica

Jet Propulsion Laboratory

UIA Presentation – April 2012

Lake Vida (77.23°S 162°E) in the McMurdo Dry valleys, Antarctica, offers a Mars analog environment for testing the detection and description of life in a previously unstudied extreme ecosystem

## Gopher Field Trips – First McMurdo, Antarctica

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Gopher Field Trips – Lake Vida, Antarctica

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Gopher Field Trips – Lake Vida, Antarctica

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Gopher Field Trips – Lake Vida, Antarctica

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Gopher Field Trips – Lake Vida, Antarctica

Jet Propulsion Laboratory

UIA Presentation – April 2012

Jet Propulsion Laboratory

## Gopher Field Trips – Lake Vida, Antarctica Results

UIA Presentation – April 2012

Demonstrated that the technology is feasible  
Learn about challenges and design changes required to enhance  
its drilling capability

Drilling depth of 1.76m is more than the total length of the  
Gopher including its support elements (pump, preload weights,  
etc.)

Ventifacts

## Current version is Auto gopher

Jet Propulsion Laboratory

UIA Presentation – April 2012

### Rotary Hammer with sidewall anchors for deeper drilling

Demonstrated 2 m in limestone

See Bar-Cohen et al. 2012

# Flexured horns: What are we doing?

Jet Propulsion Laboratory

UIA Presentation – April 2012

Stress bolt

Pre-stress flexures

# Flexured horns: Why?

Jet Propulsion Laboratory

UIA Presentation – April 2012

When designing Gopher Actuator-Transducer

**Stress bolt kept breaking**

Jet Propulsion Laboratory

UIA Presentation – April 2012

## What other benefits of Pre-stress flexure

1. Increase manufacturing yield of disks vs rings
2. No Internal Discharge to stress bolt
3. Higher energy density
4. Pre-stress is not limited by bolt diameter
5. Actuator has higher coupling  
since it is not working against stiff bolt
6. Softer spring increases thermal preload stability

High Temperature  
Drill 500 °C

Bellville Washers

## Design Example

Jet Propulsion Laboratory

UIA Presentation – April 2012

Monolithic  
design

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Manufacturing method - EBM

Chose EBM – Electron Beam Melting CALRAM Inc.

The design is also amenable to investment casting and other low cost high production techniques.

Examples from Arcam AB

- Landing gear component
- Tri-flange Implant

[www.arcam.com](http://www.arcam.com)

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Can Use Solid Stacks

Impedance spectra of the bare Piezomechanik GmbH bipolar stack  
(9.33 mm, 25.4 OD)

Small signal resonance analysis  
the bare stack

Material  $d_{33eff} = 480 \text{ pC/N}$   
 Capacitance  $C = 261 \text{ nF}$ .  
 Coupling  $k_{33} = 0.56$   
 $s_{E33} = 5.4 \times 10^{-11} \text{ m}^2/\text{N}$   
 Q was 30.

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Assembly

- Inner surfaces were finished using mill
- Flexures opened using pre-stress rig
- Stacks fixed using 3M 2216
- Preload monitored by measuring charge produced when flexures released

Assembled horns  
 $f_s = 28.5\text{-}29.3$  kHz  
 $k = 0.20\text{-}0.21$   
Mechanical Q's = 106 , 115

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Example application

Horns used in Barth Motor

Initial results - 15 RPM at 0.3 N-m

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Movie of horn used as motor

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Can we use horns to rotate and hammer?

Develop technologies for sample acquisition in extreme environments with reduced power, weight on bit and increased efficiency

- Hammering is great for breaking rock.
- Rotation is great for removing cuttings.
- This is why you have rotary hammer drills at Home depot

Can we develop a piezoelectric mechanism for hammering and with the same piezoelectric actuator induce rotation?

YES

## Single Piezo-Actuator Rotary-Hammering (SPaRH) Drill

Drilling using Hammering is limited to a few centimeters depth without a debris extraction method. Rotation with augers is beneficial in that it aids drilling and extracts drilling debris.

Previous approaches to induce rotation from extensional motion

- Create a bit with some asymmetry in shaft to induce rotation
- Impact wrenches/drivers
- Asymmetric teeth on bit

Jet Propulsion Laboratory

UIA Presentation – April 2012

# Approach

Use existing ultrasonic actuators / horns to create directional impacts on bit.

Use the micro-impacts of extension or bending at high frequency to produce macroscopic rotation.

extension

bending

Jet Propulsion Laboratory

UIA Presentation – April 2012

## An Example Design and Analysis

### Design solution

Combine fluted bit rotation (cuttings removal) with Ultrasonic/Sonic percussion (drilled media fracturing and cuttings fluidization)

Jet Propulsion Laboratory

UIA Presentation – April 2012

# Horn Analysis

Looked at a large number of horn to produce twist and extension  
Two rejected horn geometries are shown above.

Jet Propulsion Laboratory

# An acceptable horn motion

UIA Presentation – April 2012

Jet Propulsion Laboratory

UIA Presentation – April 2012

# Horn Analysis

Harmonic analysis results suggest mode is reasonably coupled

Table 1. ANSYS predicted performance of chosen transducer design at 1 W input power.

Frequency (First axial mode)	Coupling Coefficient	Tip Displacement, $\mu\text{m}$	Tip Rotation, rad	Voltage, V
12217	0.08	1.75	4.40E-5	27.0

Used Mason's 1D network  
model to determine movement  
of nodal plane

Jet Propulsion Laboratory

UIA Presentation – April 2012

# Fabrication and testing

Fabricated horn and tested its frequency response

Transducer performance derived from impedance analysis.

First Resonant Frequency	Electromechanical Coupling Coefficient
11 972 Hz	0.07

Jet Propulsion Laboratory

## Fabrication and testing

UIA Presentation – April 2012

Testing of the horn tip displacement at resonance. A fotonics fiber optic sensor was used to test both the extension and rotation at the tip at the resonance frequency

# Testing

Jet Propulsion Laboratory

UIA Presentation – April 2012

Comparison of FEM and experimental extension data  
small signal FEM predictions compare favorably to data  
at low power

Jet Propulsion Laboratory

# Drill design and Fabrication

UIA Presentation – April 2012

Impacts on free mass would transmit rotation to bit through key and still be free to expand in the axial direction. The bit and free mass preloaded using NeFeB magnets

Jet Propulsion Laboratory

UIA Presentation – April 2012

## Drilling action

Also noted at higher frequencies we could rotate in opposite direction

# Drill Testing

Jet Propulsion Laboratory

UIA Presentation – April 2012

Input Power, W	WOB, lbs	Preload, lbs	Duty Cycle	Drill Rate, mm/min
100	3	4	80 %	8

# Testing

Jet Propulsion Laboratory

UIA Presentation – April 2012

- A novel horn concept to produce hammering and rotation using a single piezoelectric transducer was investigated theoretically using a variety of modeling methods via MATLAB and ANSYS.
- A transducer design was fabricated and demonstrated simultaneous rotation and hammering.
- This Piezoelectric Rotary Hammer Drill prototype has not been optimized, and requires further development however the un-optimized version rotated at 200 RPM.
- We also noted that we could reverse the direction of rotation by driving at higher frequencies (2x)
- Future work should include considering different horn shape designs, in order to compare with the performance of this initial prototype.
- In addition looking at other geometries, horn materials such as Titanium may aid in increasing the electromechanical mechanical coupling.

# Conclusions

Jet Propulsion Laboratory

UIA Presentation – April 2012

- Ultrasonic Horns can be designed to produce many original mechanisms.
- We have just scratched the surface of Potential applications.
- We are still scratching
